November 11th, 2016

# Key concepts

We generalize the concepts from binary variables to multiple discrete outcomes.

- discrete and multinomial distributions
- the Dirichlet distribution

# The multinomial distribution (1)

Generalisation of the binomial distribution from 2 outcomes to  $m$  outcomes. Useful for random variables that take one of a finite set of possible outcomes. Throw a die  $n = 60$  times, and count the observed (6 possible) outcomes.

Outcome	Count
$X = x_1 = 1$	$k_1 = 12$
$X = x_2 = 2$	$k_2 = 7$
$X = x_3 = 3$	$k_3 = 11$
$X = x_4 = 4$	$k_4 = 8$
$X = x_5 = 5$	$k_5 = 9$
$X = x_6 = 6$	$k_6 = 13$

Note that we have one parameter too many. We don't need to know all the  $k_i$  and  $n$ , because  $\sum_{i=1}^6 k_i = n$ .

# The multinomial distribution (2)

Consider a discrete random variable  $X$  that can take one of  $m$  values  $x_1, \dots, x_m$ . Out of  $n$  independent trials, let  $k_i$  be the number of times  $X = x_i$  was observed. It follows that  $\sum_{i=1}^m k_i = n$ .

Denote by  $\pi_i$  the probability that  $X = x_i$ , with  $\sum_{i=1}^m \pi_i = 1$ .

The probability of observing a vector of occurrences  $\mathbf{k} = [k_1, \dots, k_m]^\top$  is given by the *multinomial distribution* parametrised by  $\boldsymbol{\pi} = [\pi_1, \dots, \pi_m]^\top$ :

$$p(\mathbf{k}|\boldsymbol{\pi}, n) = p(k_1, \dots, k_m | \pi_1, \dots, \pi_m, n) = \frac{n!}{k_1! k_2! \dots k_m!} \prod_{i=1}^m \pi_i^{k_i}$$

interested in count,  
not sequence.

- Note that we can write  $p(\mathbf{k}|\boldsymbol{\pi})$  since  $n$  is redundant.
- The multinomial coefficient  $\frac{n!}{k_1! k_2! \dots k_m!}$  is a generalisation of  $\binom{n}{k}$ .

The discrete or *categorical distribution* is the generalisation of the Bernoulli to  $m$  outcomes, and the special case of the multinomial with one trial:

$$p(X = x_i | \boldsymbol{\pi}) = \pi_i.$$

# Example: word counts in text

Consider describing a text document by the frequency of occurrence of every distinct word.

The UCI *Bag of Words* dataset from the University of California, Irvine.<sup>1</sup>

# Priors on multinomials: The Dirichlet distribution

The Dirichlet distribution is to the categorical/multinomial what the Beta is to the Bernoulli/binomial.

It is a generalisation of the Beta defined on the  $m - 1$  dimensional simplex.

- Consider the vector  $\boldsymbol{\pi} = [\pi_1, \dots, \pi_m]^\top$ , with  $\sum_{i=1}^m \pi_i = 1$  and  $\pi_i \in (0, 1) \ \forall i$ .
- Vector  $\boldsymbol{\pi}$  lives in the open standard  $m - 1$  simplex.
- $\boldsymbol{\pi}$  could for example be the parameter vector of a multinomial. [Figure on the right  $m = 3$ .]

The Dirichlet distribution is given by

$$\text{Dir}(\boldsymbol{\pi} | \alpha_1, \dots, \alpha_m) = \frac{\Gamma(\sum_{i=1}^m \alpha_i)}{\prod_{i=1}^m \Gamma(\alpha_i)} \prod_{i=1}^m \pi_i^{\alpha_i - 1} = \frac{1}{B(\boldsymbol{\alpha})} \prod_{i=1}^m \pi_i^{\alpha_i - 1}$$

- $\boldsymbol{\alpha} = [\alpha_1, \dots, \alpha_m]^\top$  are the shape parameters.
- $B(\boldsymbol{\alpha})$  is the multivariate beta function.
- $E(\pi_j) = \frac{\alpha_j}{\sum_{i=1}^m \alpha_i}$  is the mean for the  $j$ -th element.

# Dirichlet Distributions from Wikipedia

# The symmetric Dirichlet distribution

In the symmetric Dirichlet distribution all parameters are identical:  $\alpha_i = \alpha$ ,  $\forall i$ .  
[en.wikipedia.org/wiki/File:LogDirichletDensity-alpha\\_0.3\\_to\\_alpha\\_2.0.gif](https://en.wikipedia.org/wiki/File:LogDirichletDensity-alpha_0.3_to_alpha_2.0.gif)  
To sample from a symmetric Dirichlet in  $D$  dimensions with concentration  $\alpha$  use:  
`w = randg(alpha,D,1); bar(w/sum(w));`

Distributions drawn at random from symmetric 10 dimensional Dirichlet distributions with various concentration parameters.
